## CLAIMS

- 1-5. (Cancelled)
- (Previously Presented) A method of communicating video frames over a communications link comprising shortening a blanking period in the data to accommodate auxiliary data, without dropping any of the video frames.
- (Previously Presented) The method of Claim 6, comprising modifying at least one HSYNC signal in the data to accommodate said auxiliary data.
- (Original) The method of Claim 6, wherein said auxiliary data is audio data.
- (Original) The method of Claim 6, wherein said communications link is a digital communications link.
- (Previously Presented) The method of Claim 6, comprising modifying a VSYNC signal in all frames in which the auxiliary data is to be transmitted.
- (Previously Presented) The method of Claim 10, further comprising inserting a notch in all said VSYNC signals.
- (Previously Presented) The method of Claim 11, wherein inserting said notch includes inserting an 8 clock cycle pulse into said VSYNC signals.
- (Previously Presented) The method of Claim 12, further wherein said notch is inserted into said VSYNC signals 8 clock pulses after a first edge of said VSYNC signals.

- (Original) The method of Claim 10, further comprising adapting at least one control signal to be compliant with a content protection standard.
- (Original) The method of Claim 14, wherein said at least one control signal is adapted to be compliant with said content protection standard while transmitting said auxiliary data.
- (Original) The method of Claim 14, wherein said control signal is ctl3.
- (Original) The method of Claim 14, wherein said content protection standard comprises a High-bandwidth Digital Content Protection standard.
- (Original) The method of Claim 14, wherein adapting said control signal comprises generating a ctl3 input using at least one VSYNC signal.
- (Original) The method of Claim 18, further comprising ensuring that the ctl3 input is a positive going pulse.

20-22. (Cancelled).
